

MAZE SOLVER BOT

ALGORITHM

LEFT HAND TURN

The basic idea of this algorithm is that the bot should turn and explore the track by only turning left at a junction.

Left Prioritize Algorithm

This algorithm is used to move the bot in the required direction.

- ✓ **Case-1: Only middle sensor detects line**

Bot moves forward

- ✓ **Case-2: Only Left sensor detects line**

Bot turns left

- ✓ **Case-3: Only right sensor detects line**

Bot turns right

- ✓ **Case-4: If left sensor detects line along with middle sensor**

The bot shall turn left.

- ✓ **Case-5: If left sensor and right sensor detects line**

The bot shall turn left.

- ✓ **Case-6: If all the sensors detect line** (caution this is a tricky case)

- **Situation 1: The detect line is a T-junction**

In this case the bot should make a left turn.

✓ **Case-7: If no sensor detects the line**

The bot shall make a left turn until any sensor detects a line and then move according to above cases.

✓ **Case-8: If right sensor detects line along with middle sensor**

○ **Situation 1: T-junction**

- The bot shall move forward (T-junction)

○ **Situation 2: right turn**

- the bot again moves forward, making it similar to when no sensor detects a line.

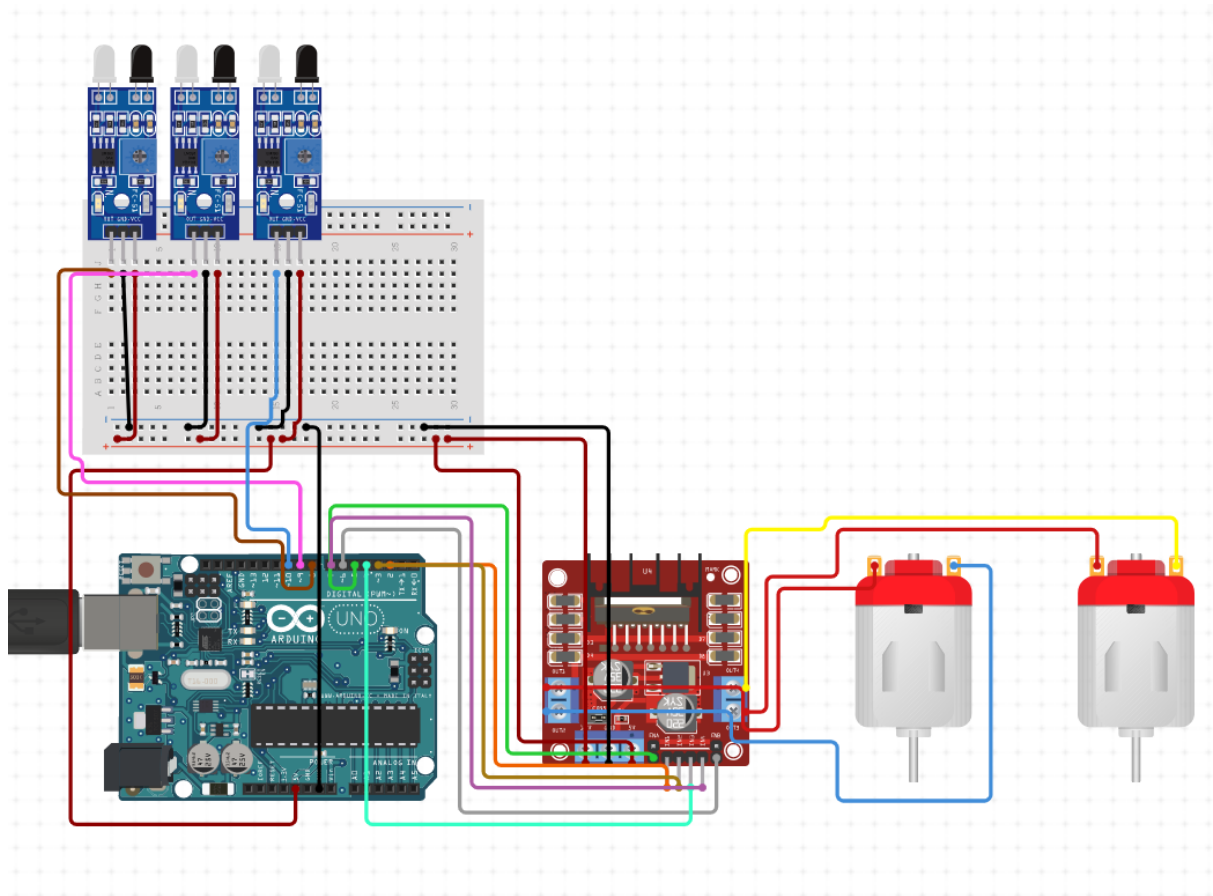

CONNECTIONS & COMPONENTS

H Bridge

Infrared Sensor Module

Connections

Connections between Arduino Uno, Motor Drivers and H bridge
